1. What is a primary characteristic that differentiates non-functional requirements from functional requirements? 1 point

- Non-functional requirements are optional and can be ignored during system design.
- Non-functional requirements are only concerned with the user interface design.
- Non-functional requirements specify the exact features and functionalities of a system.
- Non-functional requirements describe how a system performs a function.

2. Why is it important to differentiate between short-term and long-term capacity needs? 1 point

- To ensure resources are allocated efficiently to meet current and future demands
- To improve the software's user interface design
- To reduce the software development timeline
- To eliminate the need for software updates

3. What is a potential drawback of not considering scalability during the initial design phase? 1 point

- Immediate reduction in software functionality.
- Complete elimination of software bugs.
- Decreased initial user adoption rates.
- Increased difficulty in accommodating future growth.

4. Which aspect of non-functional requirements can directly influence the user experience? 1 point

- System performance and reliability.
- The color scheme used in the interface.
- The marketing strategy for the product.
- The number of features available.

5. Which of the following actions is crucial for optimizing performance in a computing system? 1 point

- Disable all firewall and security features.
- Use outdated hardware to maintain compatibility.
- Regularly update software and drivers.
- Increase the number of background applications.

6. What is a key consideration when implementing a monitoring strategy? 1 point

- Focusing only on the technical aspects of the system.
- Collecting as much data as possible without regard to relevance.
- Ensuring that the data collected aligns with business objectives.
- Using manual processes to ensure data accuracy.

7. Which factor is crucial when designing a disaster recovery plan? 1 point

- The frequency of software updates.
- The time it takes to restore operations after a failure.
- The number of backup servers available.
- The amount of data stored in the cloud.
